Project Name:

Bus Reservation System

Description:

In this Project, the user can book a ticket, update that ticket details, view and manage tickets within that particular system, displays unreserved and reserved seats based on particular Bus ID, checks whether the details of the tickets are saved or not and can be used to view all the ticket list and also remove the details of the ticket if it's no longer needed. This program provides all basic features of a real bus management system. The file shall be utilized to store the data of bus details. So, upon every run of the program, previously kept information concerning the system is not lost.

A user ID will be required to use this program every time its run after being closed. This program will be based on C++ programming language and its Object-oriented techniques and strategies shall be used to implement above mentioned features into this bus management system.

P.S: This project will be a console-based program without Graphical Elements.

Tools:

DevC++ (coding purpose)
